

Cortical Encoding of Auditory Objects at the Cocktail Party

Jonathan Z. Simon
University of Maryland

Introduction

- Auditory Objects
- Magnetoencephalography (MEG)
- Neural Representations of Auditory Objects in Cortex: Decoding
- Neural Representations of Auditory Objects in Cortex: Encoding

Auditory Objects

- What is an auditory object?
 - perceptual (not neural) construct
 - commonalities with visual objects
 - several potential formal definitions

Auditory Object Definition

- Griffiths & Warren definition:
 - corresponds with *something* in the sensory world
 - object information *separate from* information of rest of sensory world
 - abstracted: object information *generalized over particular* sensory experiences

Auditory Objects

- a few more details...
- punctate or streaming, serial or parallel
- not quite “*what*” in “*what vs. where*”

Experiments

Magnetoencephalography (MEG)

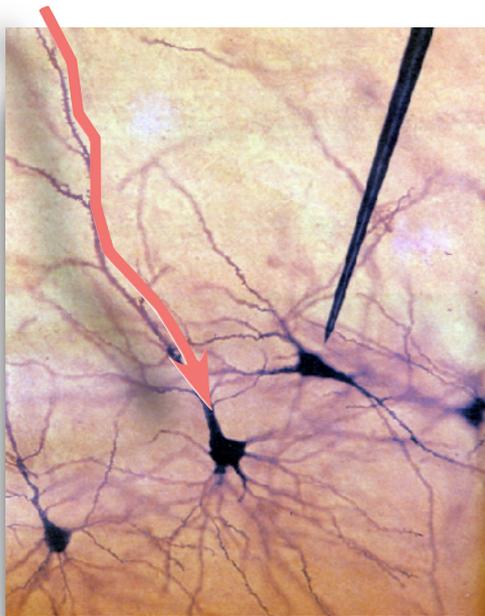

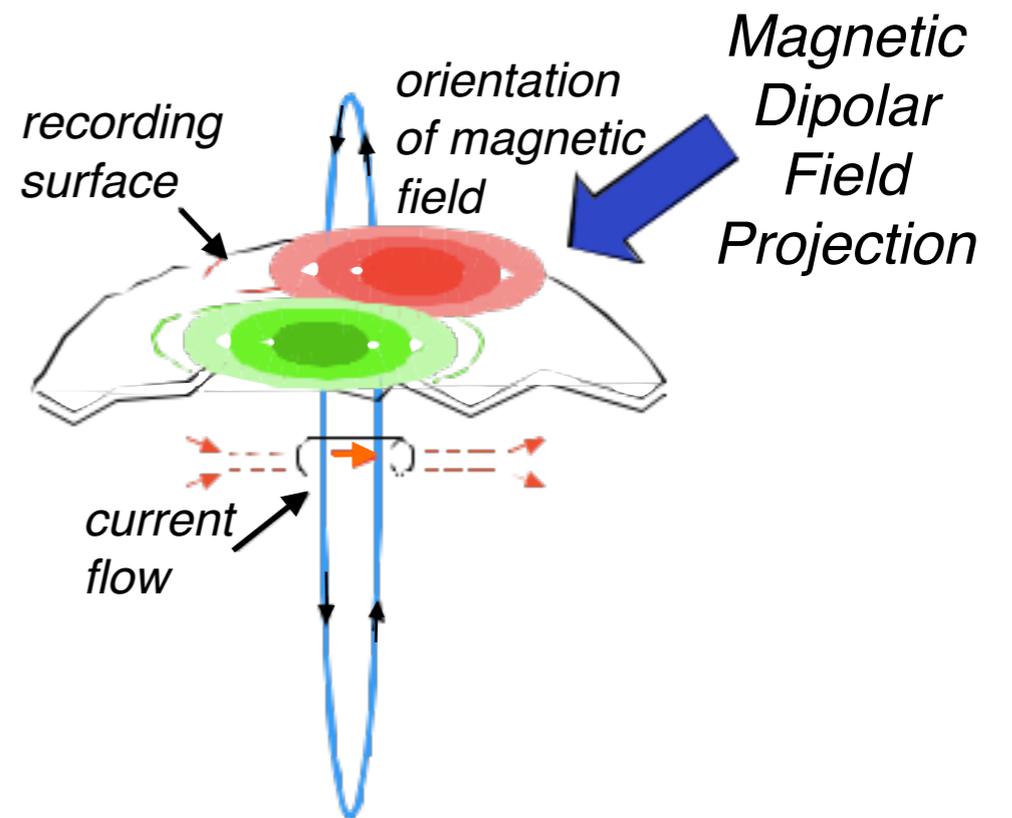

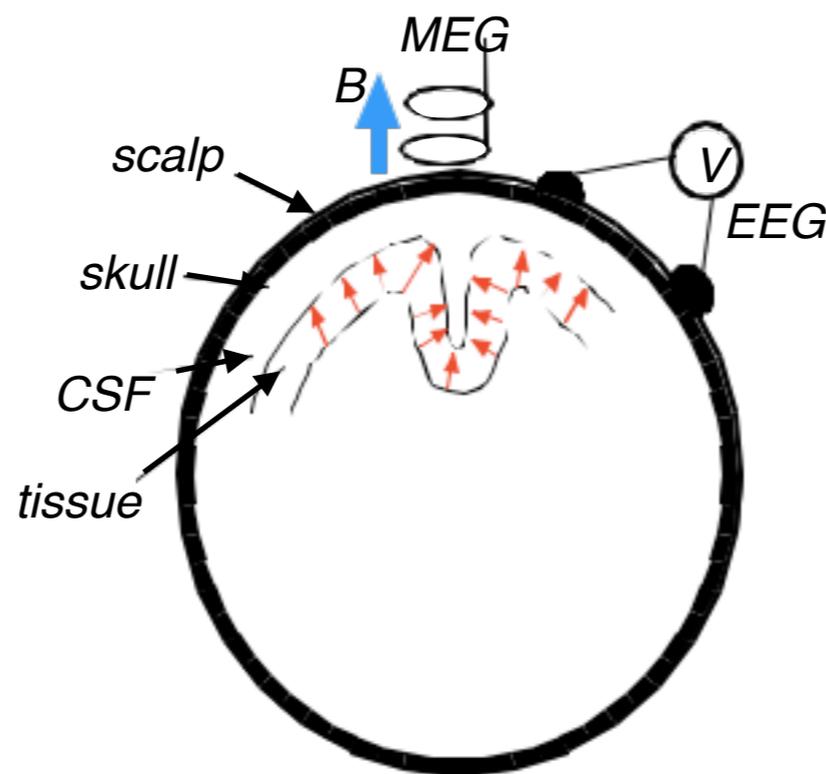

Photo by Fritz Goro

- Direct electrophysiological measurement
 - not hemodynamic
 - real-time
- No unique solution for distributed source

- Measures spatially synchronized cortical activity
- Fine temporal resolution (~ 1 ms)
- Moderate spatial resolution (~ 1 cm)

Magnetoencephalography (MEG)

(up to ~ 10 Hz)

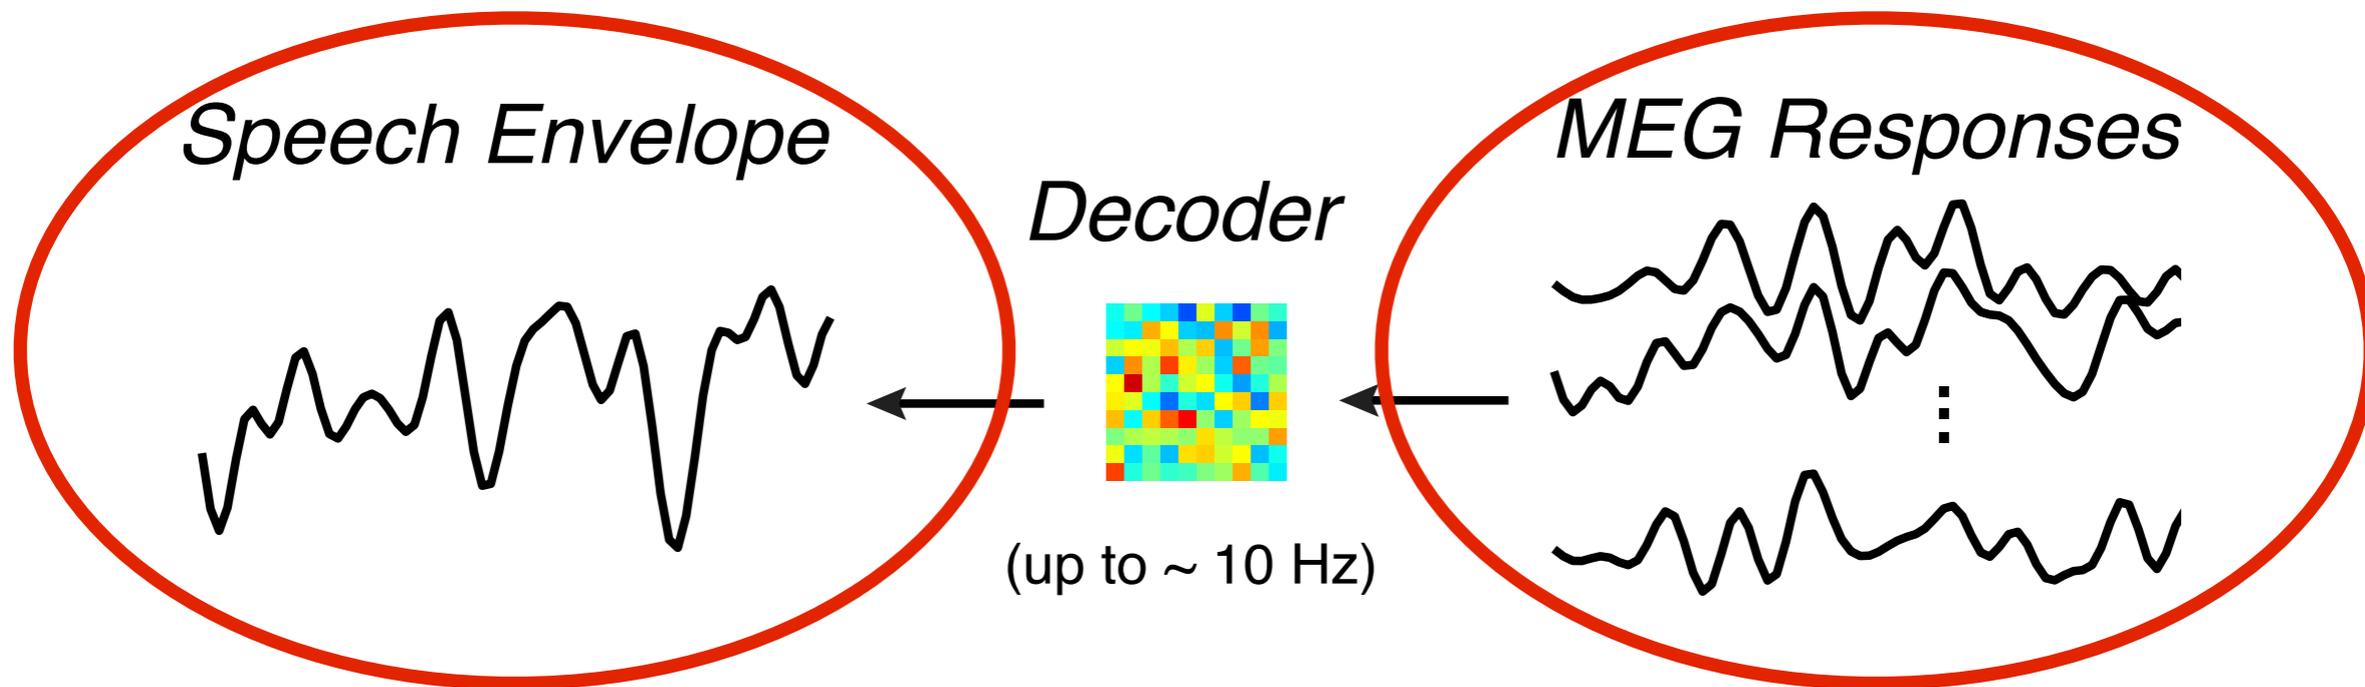

MEG Responses

Neural Reconstruction of Speech Envelope

Reconstruction accuracy comparable to single unit & ECoG recordings

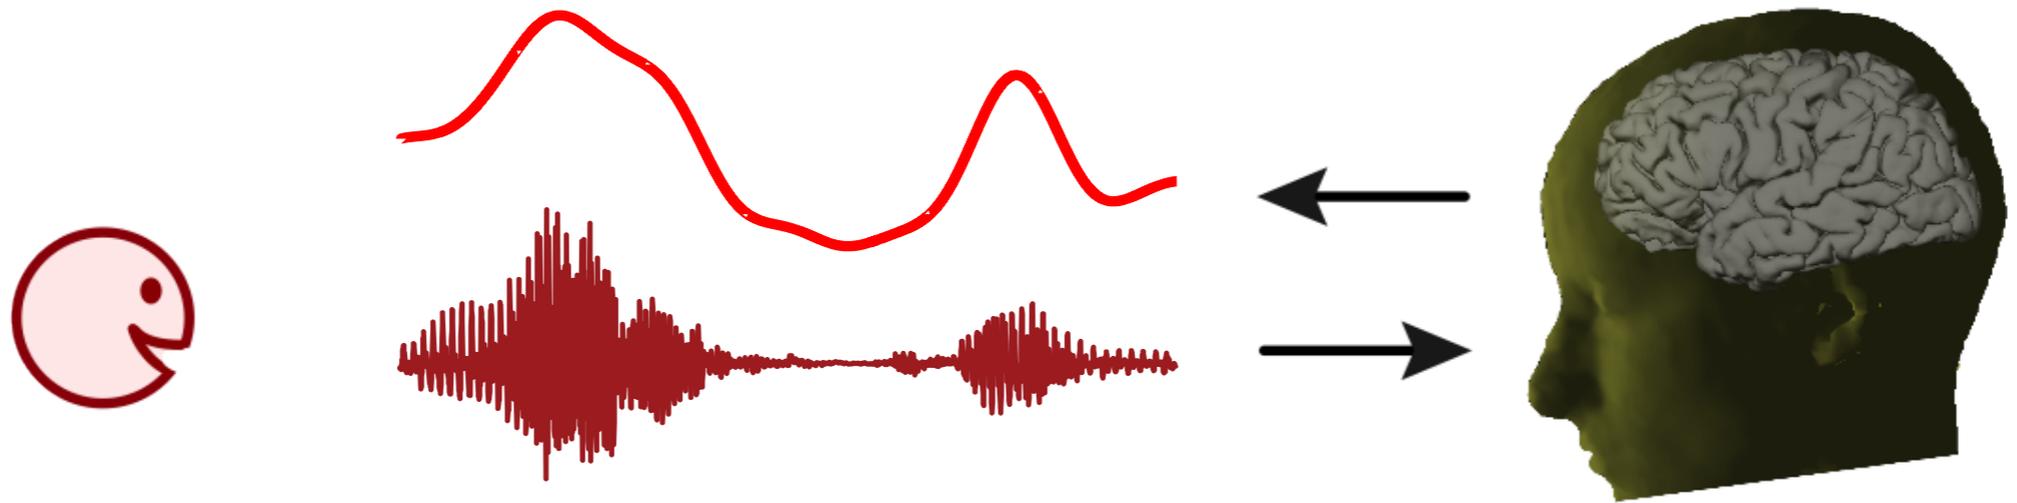

Speech Stream as an Auditory Object

- corresponds with something in the sensory world
- information *separate from* information of rest of sensory world
e.g. other speech streams or noise
- abstracted: object information *generalized over particular* sensory experiences
e.g. different sound mixtures

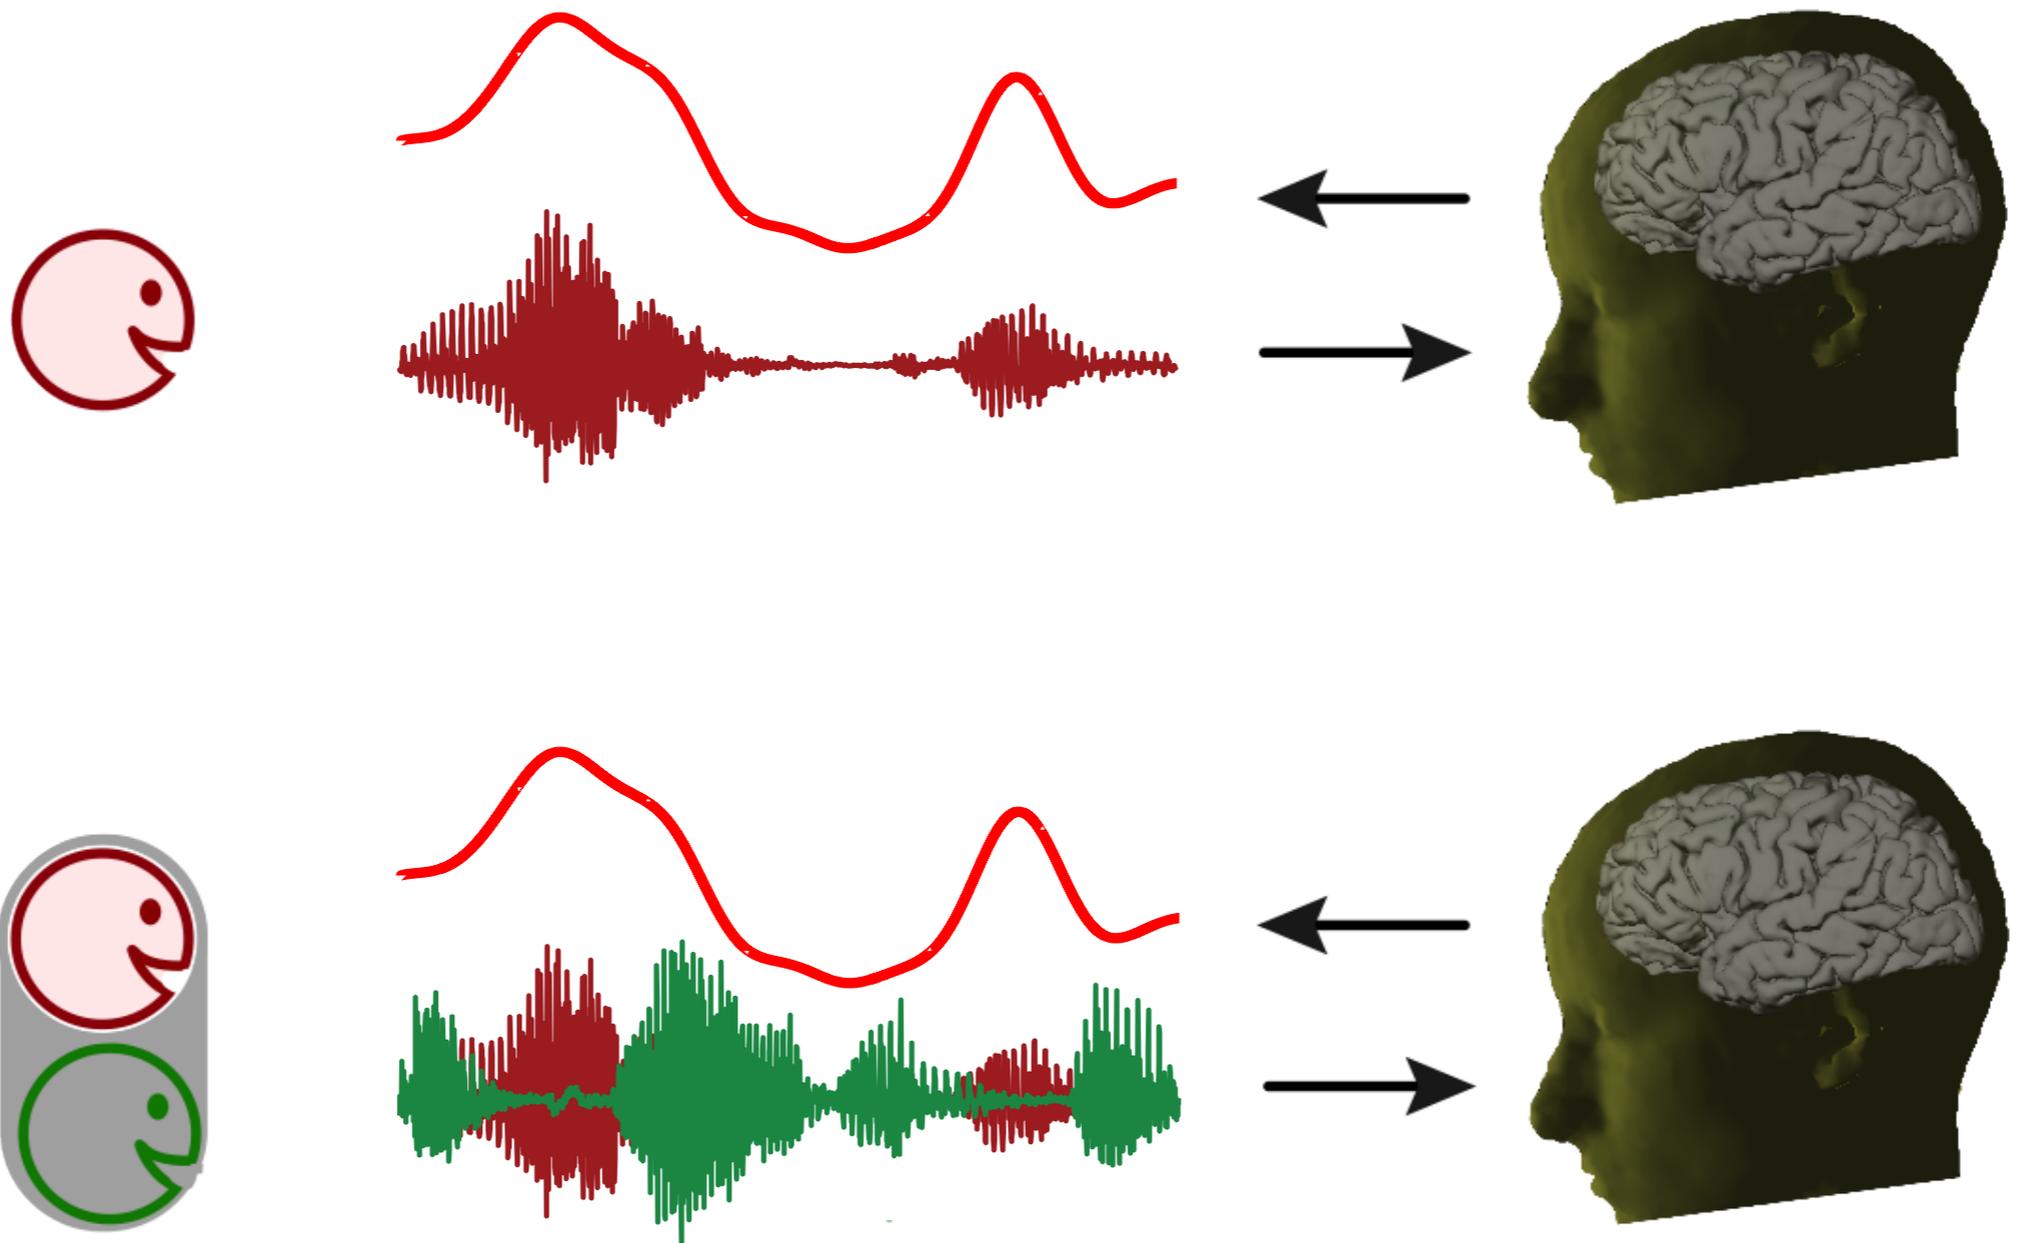

Neural Representation of an Auditory Object

- neural representation is of something in sensory world
- when other sounds mixed in, neural representation is of auditory object, not entire acoustic scene
- neural representation invariant under broad changes in specific acoustics

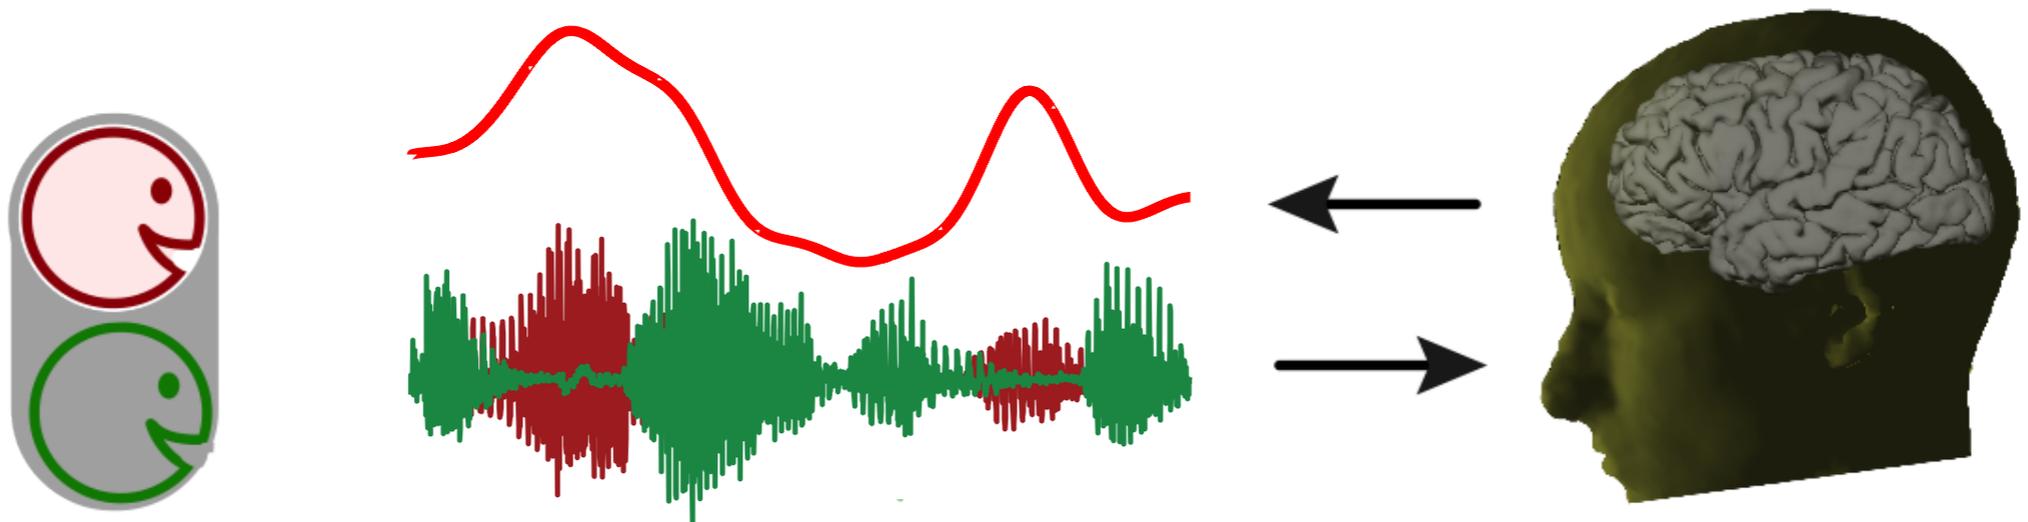

Selective Neural Encoding

Stimulus-Based

Neural Results

- Stream-based not stimulus-based
- Neural representation is invariant to acoustic changes.

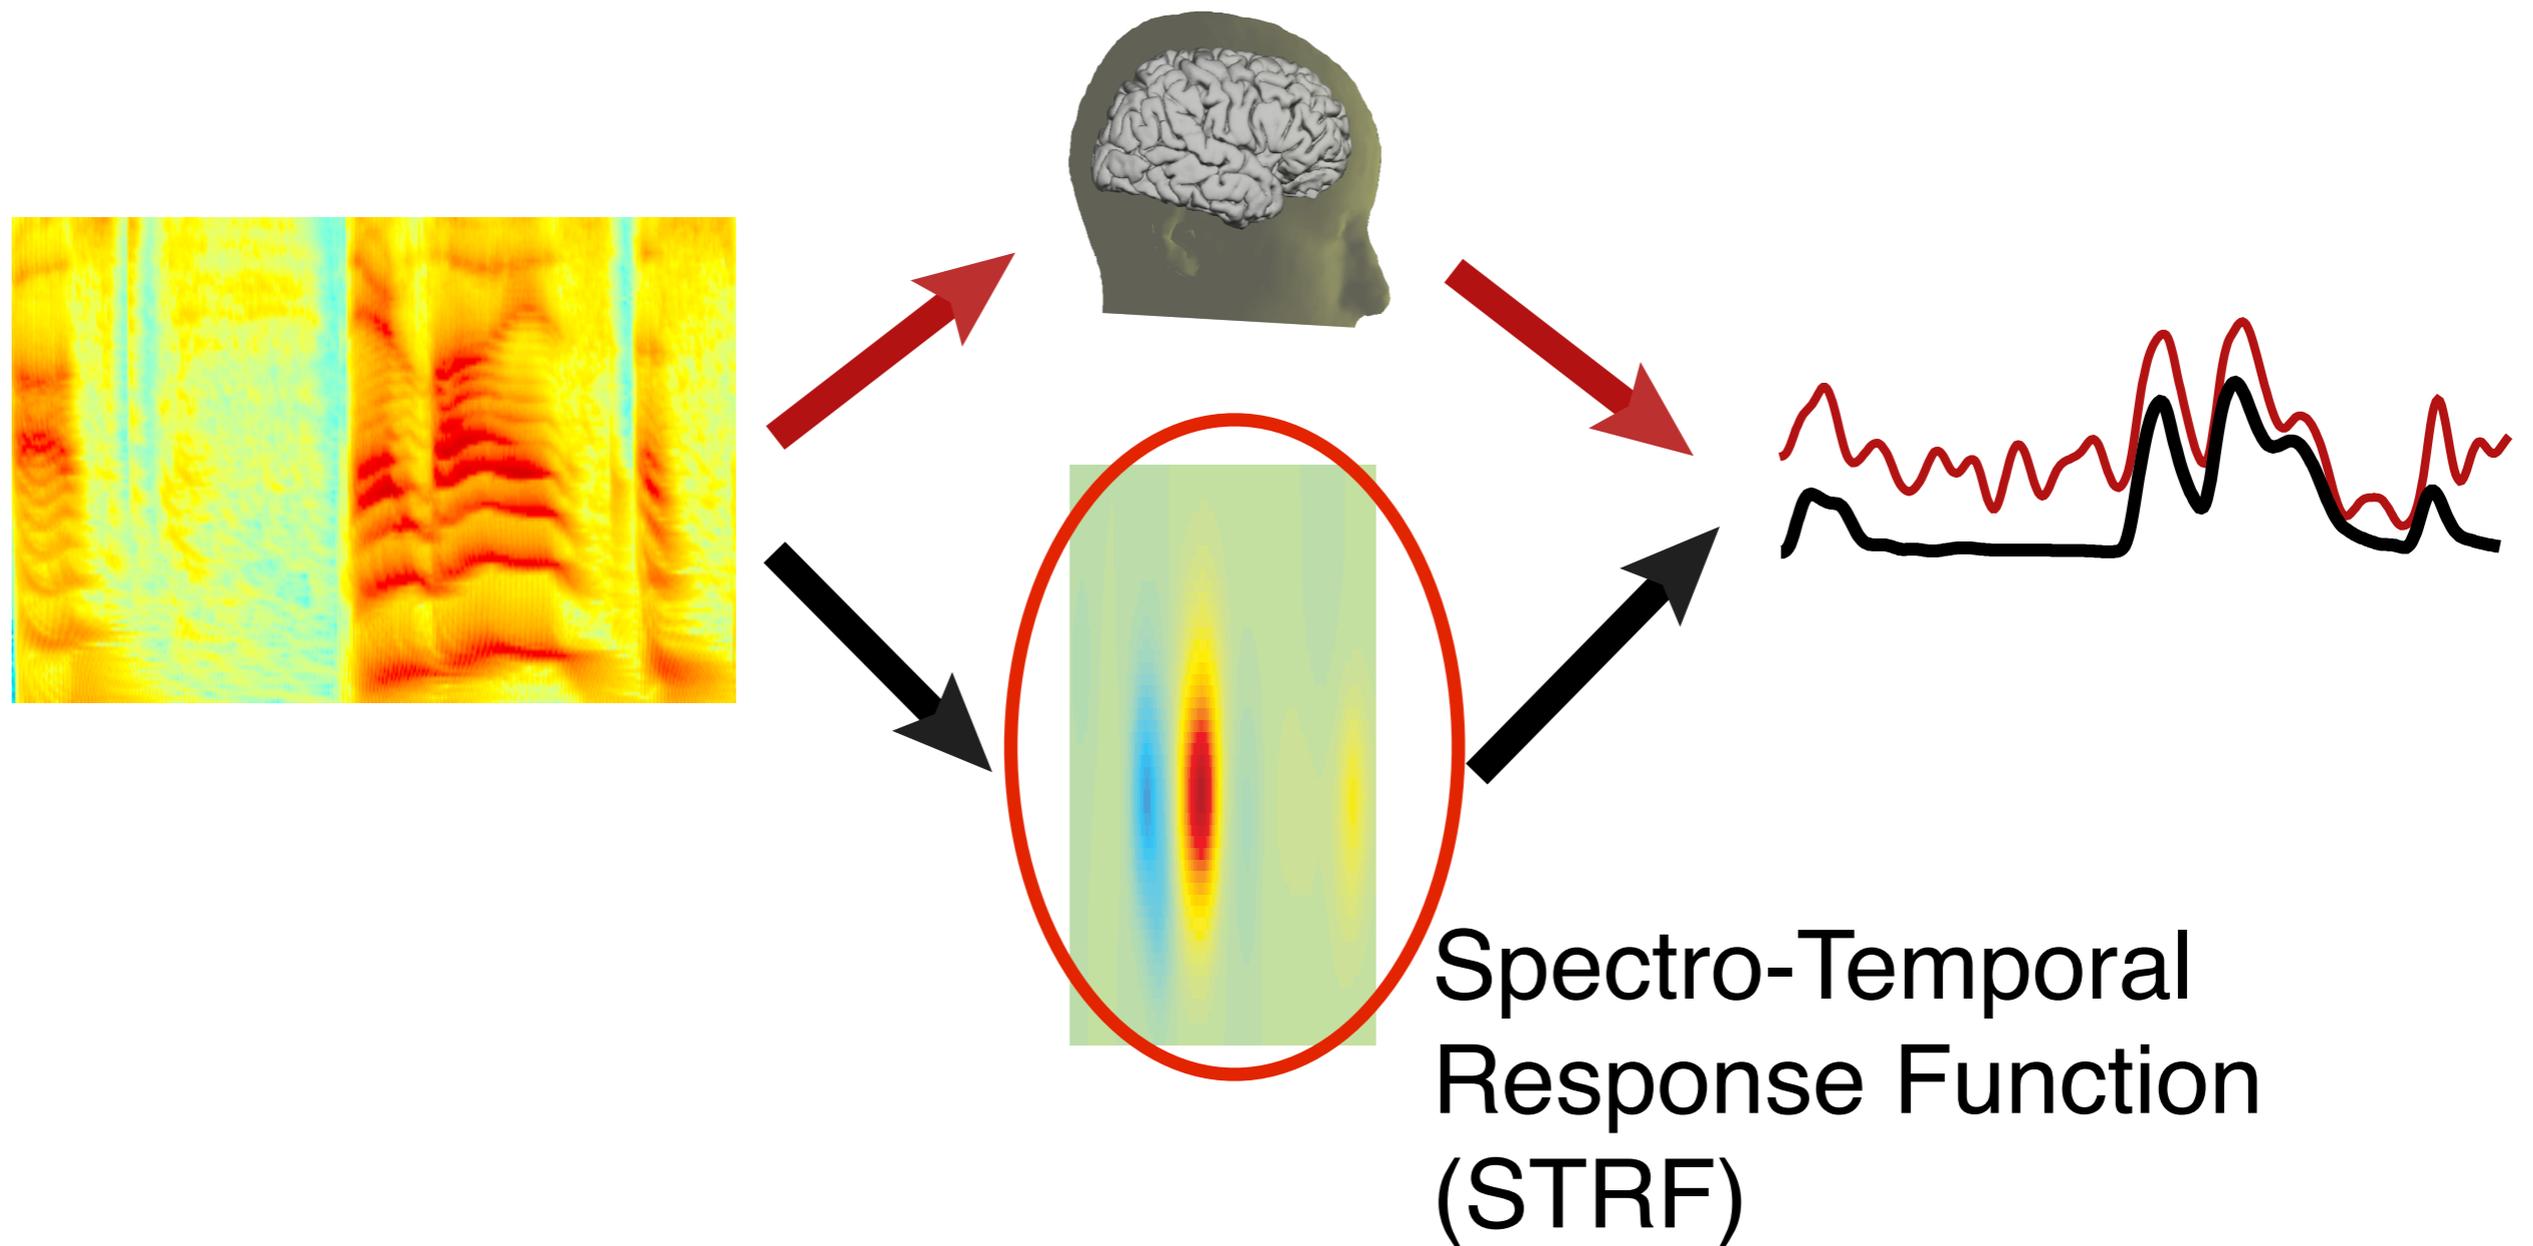

Neural Representation of an Auditory Object

- ✓ neural representation is of something in sensory world
- ✓ when other sounds mixed in, neural representation is of auditory object, not entire acoustic scene
- ✓ neural representation invariant under broad changes in specific acoustics

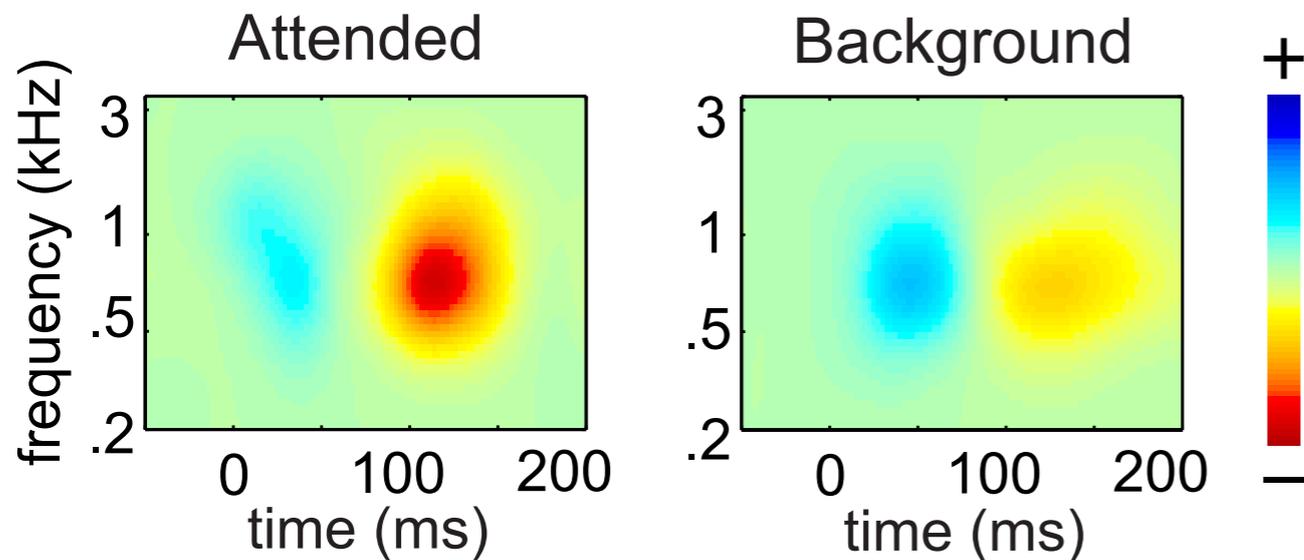

Forward STRF Model

Forward STRF Model

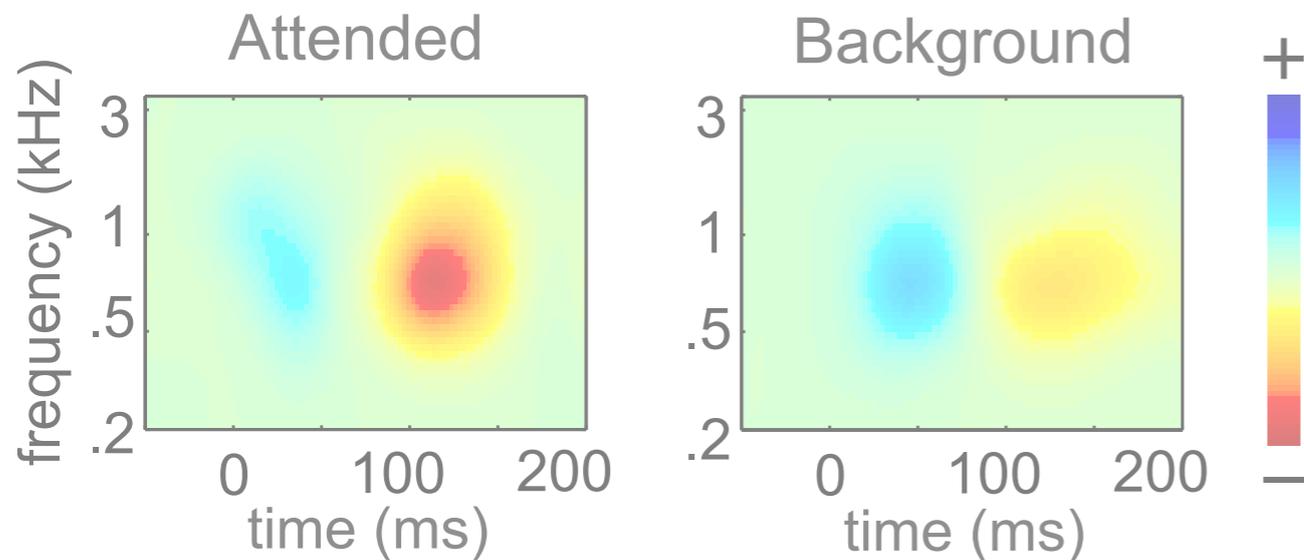

STRF Results

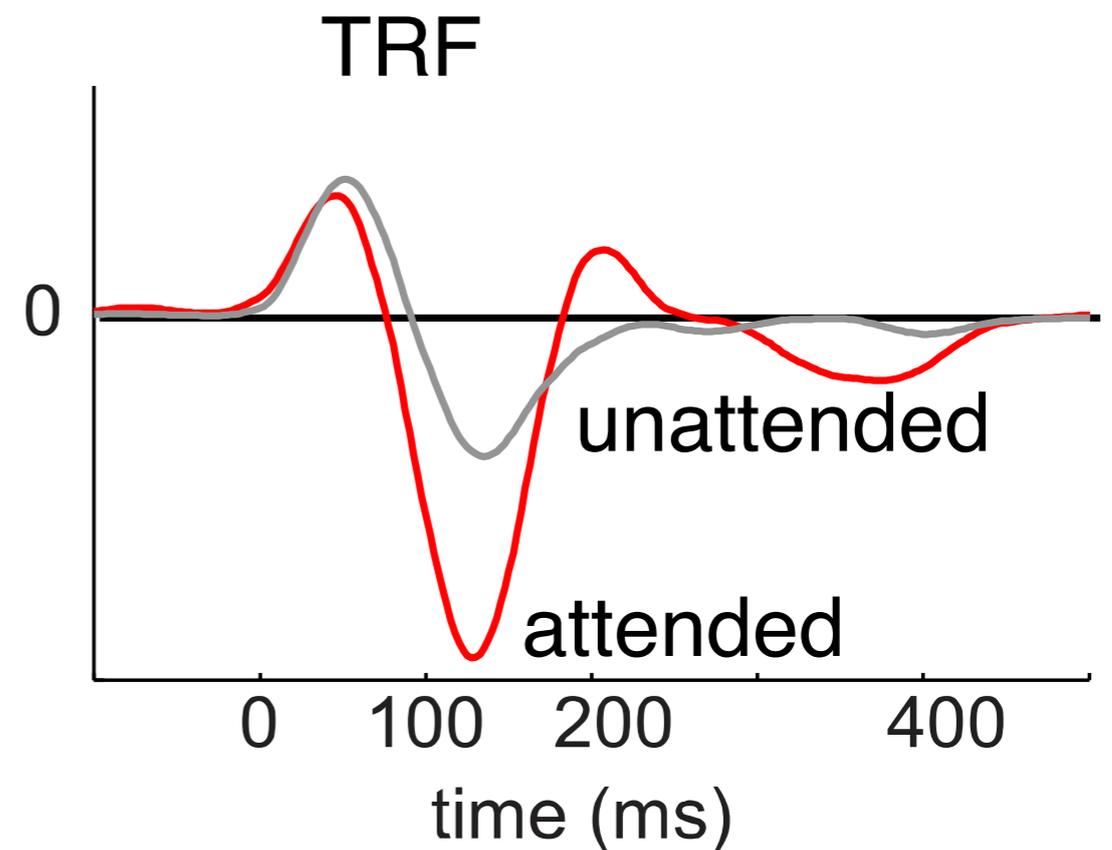

- STRF separable (time, frequency)
- 300 Hz - 2 kHz dominant carriers
- M50_{STRF} positive peak
- M100_{STRF} negative peak

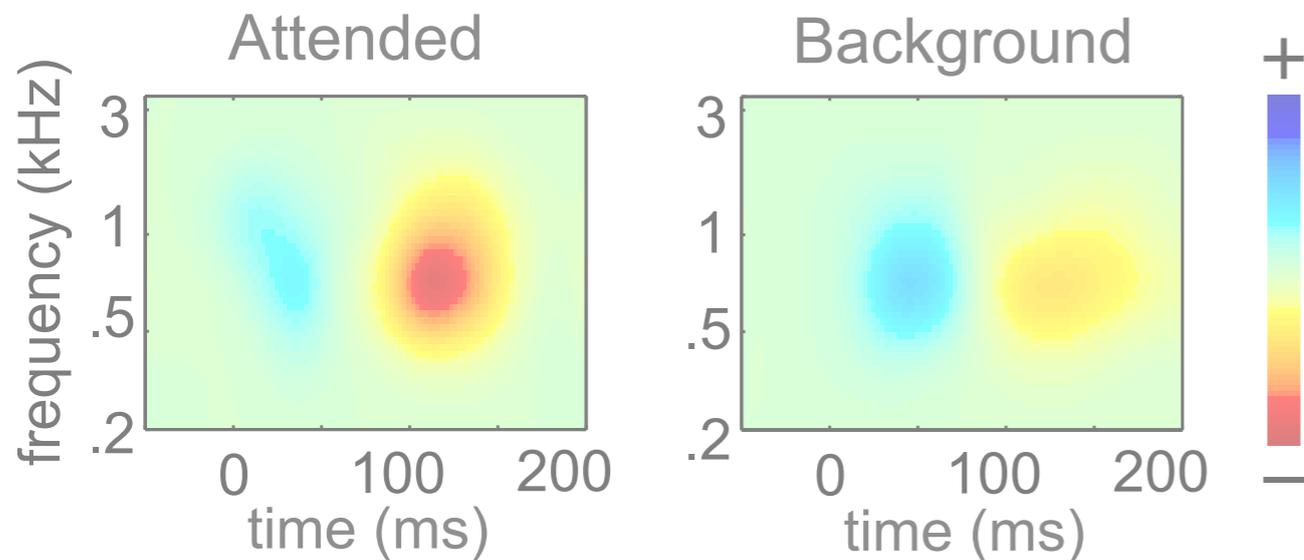

STRF Results

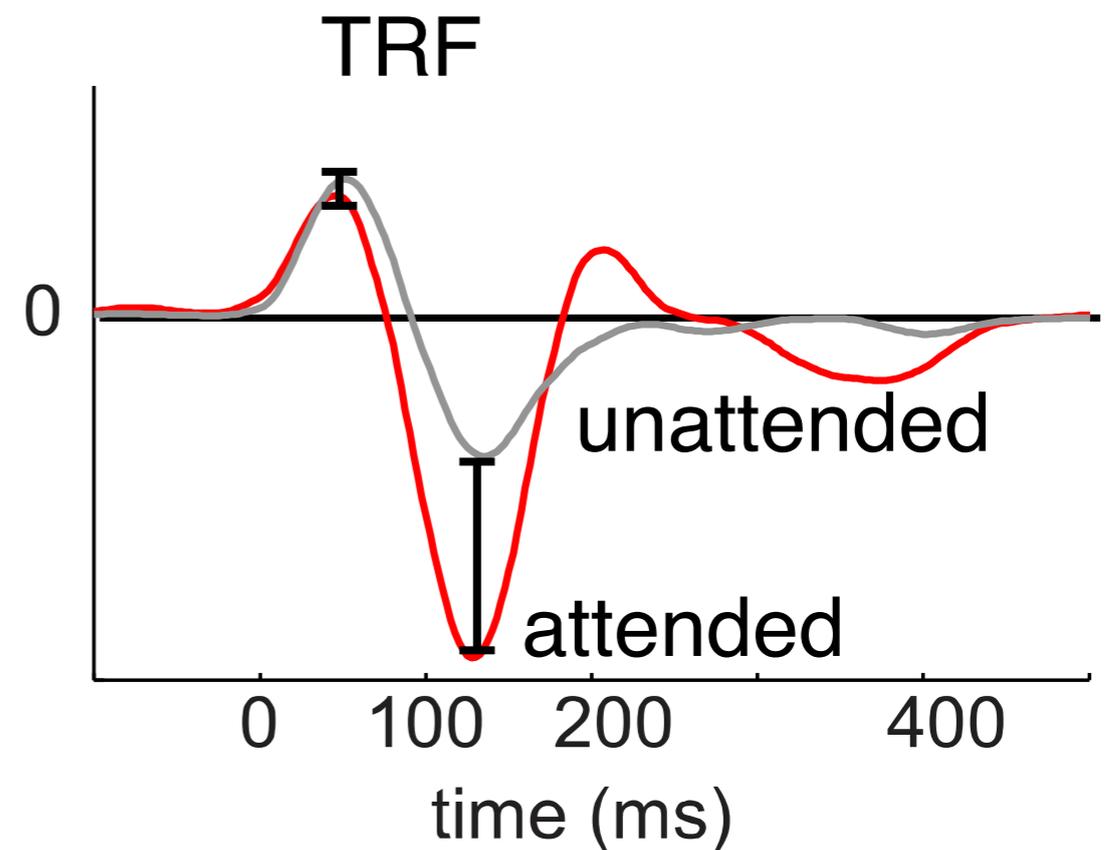

- STRF separable (time, frequency)
- 300 Hz - 2 kHz dominant carriers
- M50_{STRF} positive peak
- M100_{STRF} negative peak

STRF Results

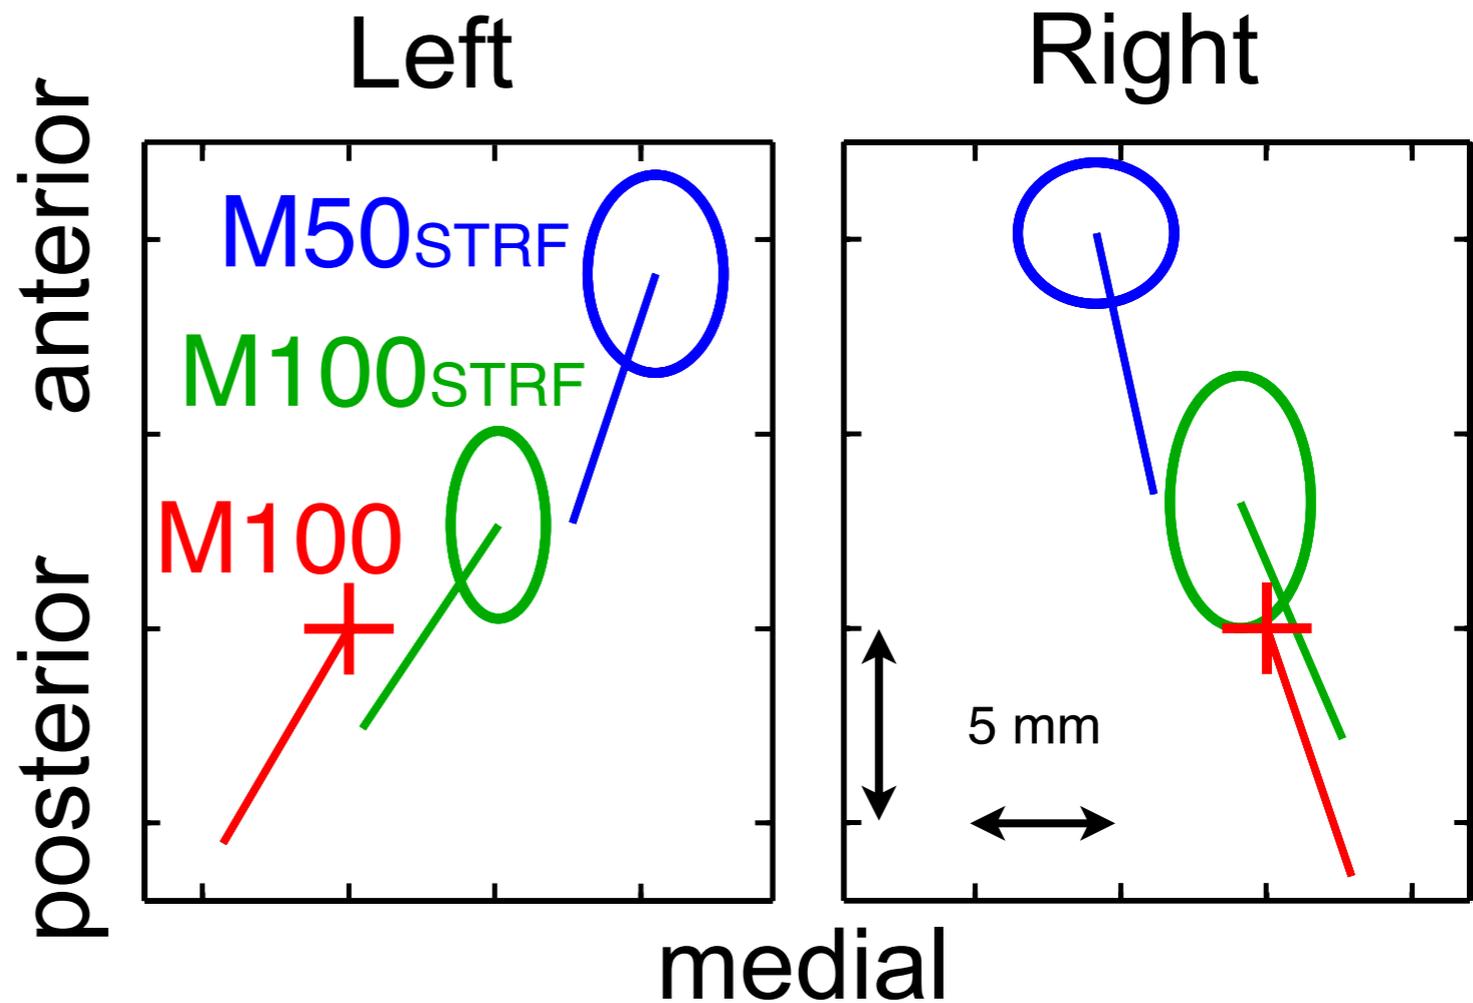

- STRF separable (time, frequency)
- 300 Hz - 2 kHz dominant carriers
- $M50_{STRF}$ positive peak
- $M100_{STRF}$ negative peak
- **$M100_{STRF}$ strongly modulated by attention, *but not* $M50_{STRF}$**

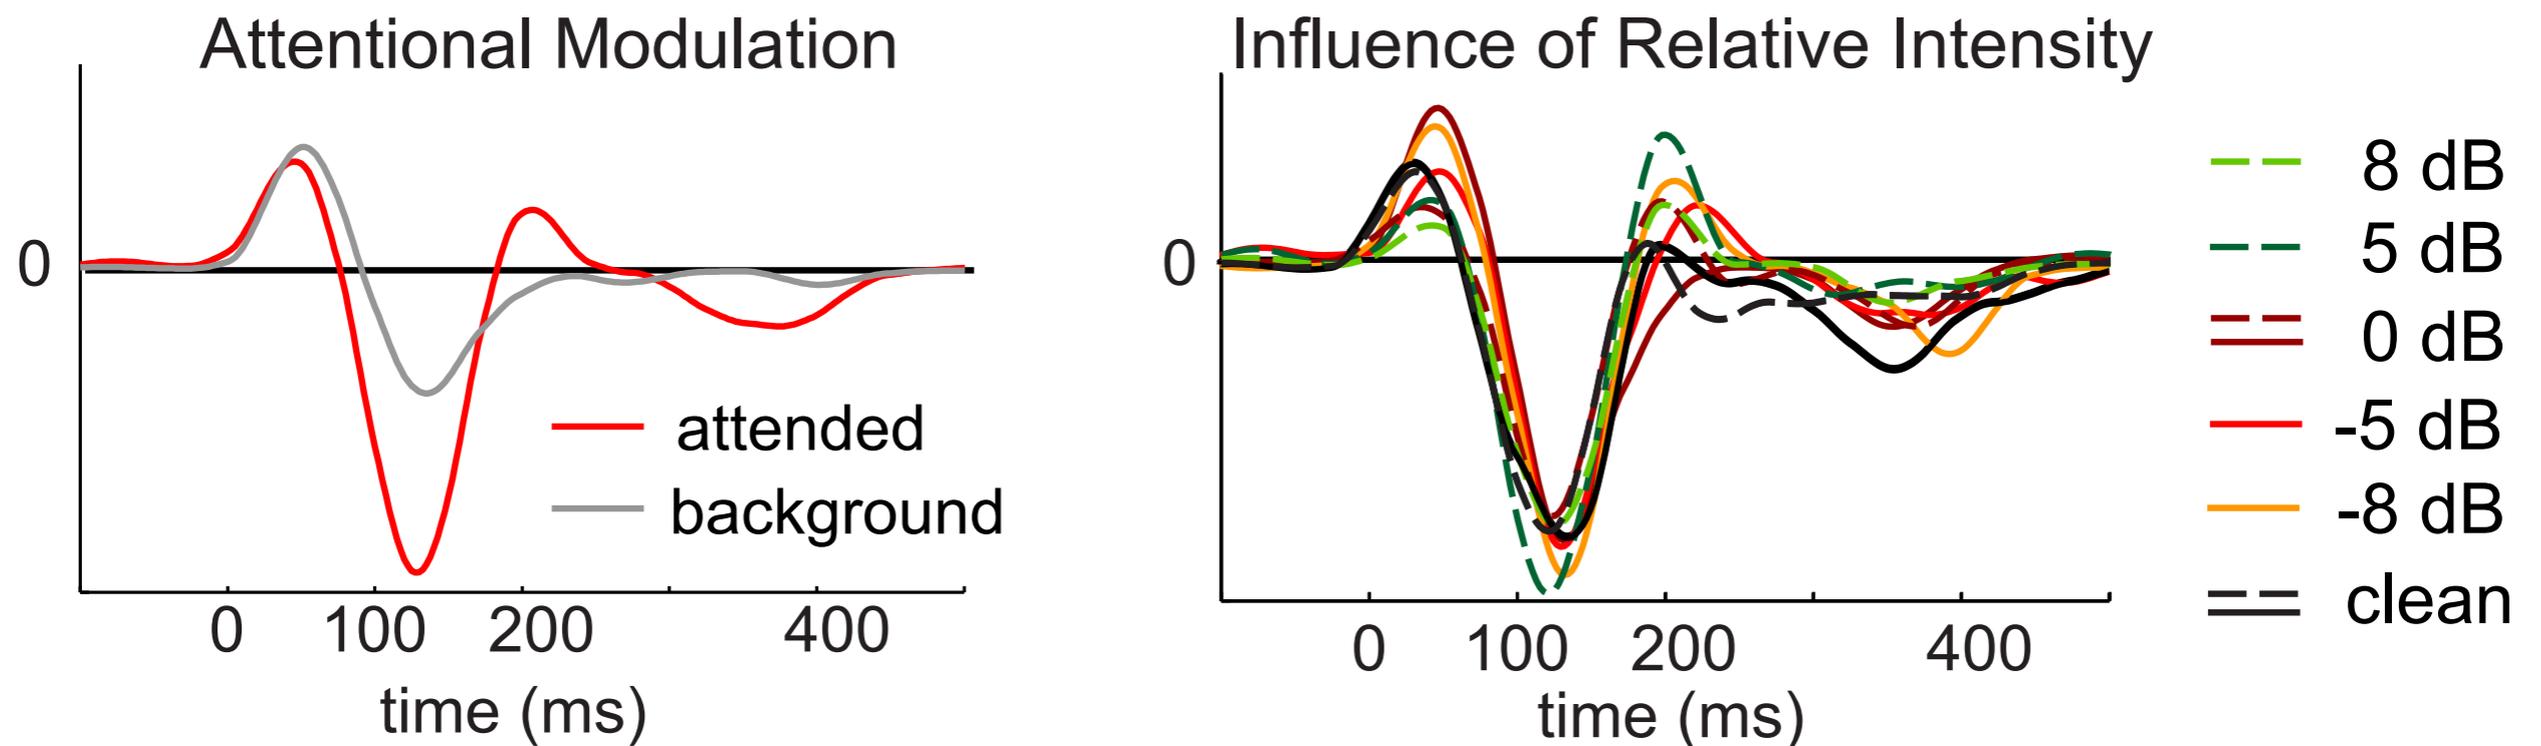

Neural Sources

- M100_{STRF} source near (same as?) M100 source: PT
- M50_{STRF} source is anterior and medial to M100 (same as M50?): HG

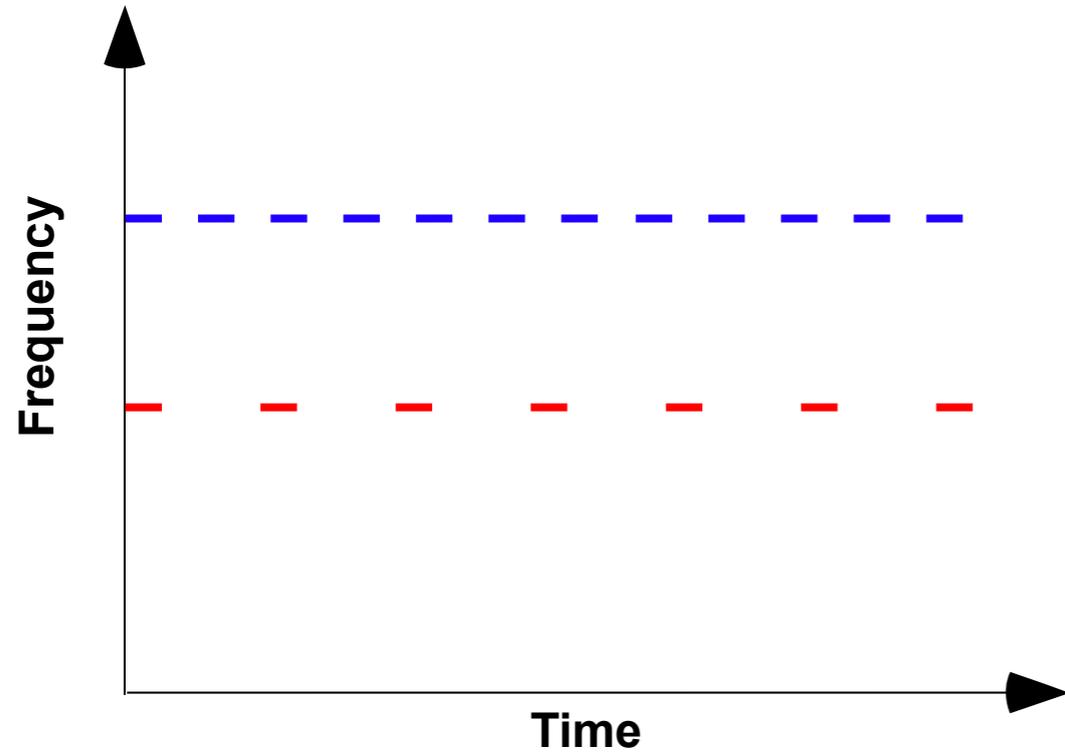

Cortical Object-Processing Hierarchy

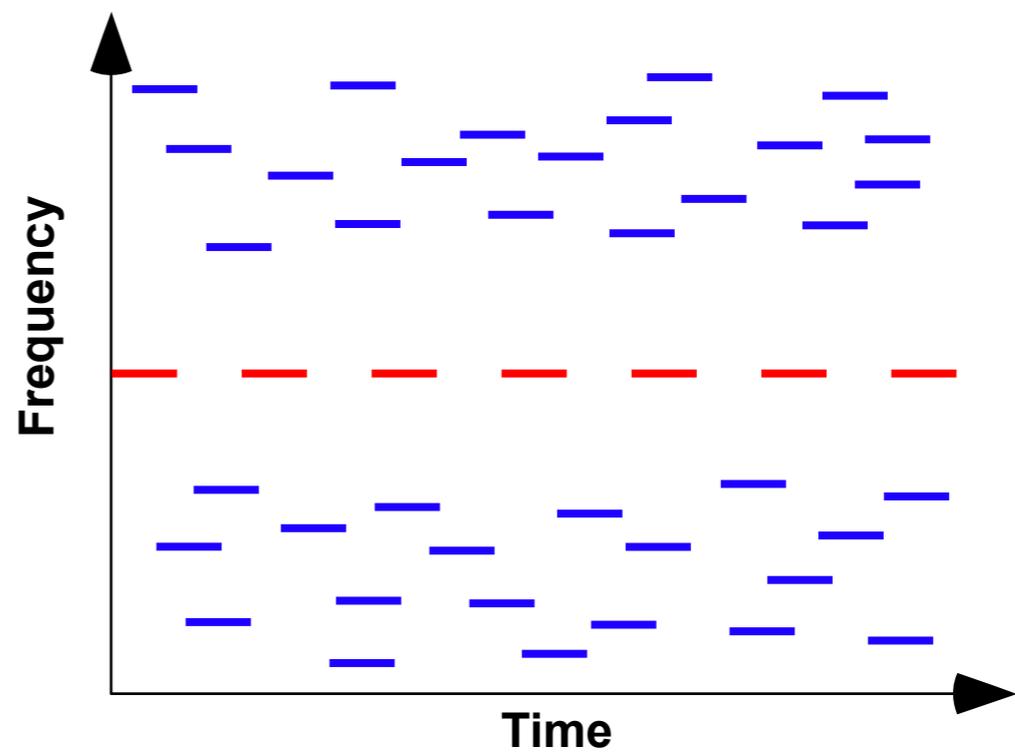

- $M_{100\text{STRF}}$ strongly modulated by attention, but not $M_{50\text{STRF}}$.
- $M_{100\text{STRF}}$ invariant against acoustic changes.
- Objects well-neurally represented at 100 ms, but not 50 ms.

Summary

- Cortical representations of speech found here:
 - ✓ consistent with being *neural* representations of auditory (*perceptual*) objects
 - ✓ meet 3 formal criteria for auditory objects
- Object representation fully formed by 100 ms latency (PT), but not by 50 ms (HG)
- Not special to speech
